Bare Minerals Makeup Approved List

Every liquid foundation, tinted moisturizer, and BB Cream contains pore-clogging ingredients. Loose, mineral powder tends to be the safest choice but the ingredients should still be checked.

In our experience only about 1% of the population has a reaction to bismuth oxychloride due to its crystalline structure, which can “poke” at the skin, get stuck in the pores, cause irritation, and aggravate acne. Bismuth oxychloride is not a pore-clogging ingredient; however, if you are sensitive to bismuth oxychloride then you should look for makeup lines that don't contain the ingredient.

For those who are not sensitive to bismuth oxychloride, Bare Minerals Original Formula loose powder foundation is an easy-to-find and safe choice for acne-prone individuals. The newer Bare Minerals Matte and Bare Minerals READY lines are not a safe choice - they contain ActiveSoil Complex that may cause breakouts. We do not recommend any of the pressed Bare Minerals blushes, bronzers, or veils.
